

MILESTONE 6

Reporting in Fabric

A Power BI dashboard on the Gold star schema, answering real business questions

STEP 1

Bring Gold into Fabric

WHAT

Connected Power BI directly to the Databricks SQL warehouse (Azure AD auth) and imported the four Gold tables into a Fabric semantic model. The mirroring and OneLake-shortcut routes were attempted first.

WHY

Because Gold is built as managed Unity Catalog tables (an M4 decision), a OneLake shortcut to an external path was impractical and mirroring hit a storage-permission limit. A direct warehouse connection serves the same Gold model reliably. The requirement, a dashboard on Gold, is fully met.

1

STEP 1 · SCREENSHOT

Bring Gold into Fabric

Selecting the four atliq.gold tables (mirroring wizard, first route attempted)

STEP 2

Model the Star Schema

WHAT

Set relationships in the semantic model: fact_sales to dim_customer, dim_product, and dim_date on their keys. Marked dim_date as a date table so time-intelligence works.

WHY

The star schema is what makes the report fast and simple: the fact holds the measures, the dimensions hold the descriptive context. Marking dim_date as a date table unlocks month, quarter, and year analysis.

Model the Star Schema

Model view: fact_sales related to dim_customer, dim_product and dim_date

STEP 3

Define the Measures

WHAT

Wrote DAX measures with the revenue definition built in: Revenue (Placed, Shipped, Delivered), Returned Revenue (separate), plus Total Orders and Total Customers. Cohort membership is derived from each customer's first order month.

WHY

Baking the revenue rule into one measure means every visual shares the same definition. Keeping Returned separate makes net revenue unambiguous.

Define the Measures

Model with the measures table: Revenue, Returned Revenue, Total Orders, Total Customers

STEP 4

Build the Four Visuals

WHAT

Revenue trend by month, top products by revenue, top cities by revenue, and a cohort matrix for new vs returning customers. Each answers a business question leadership actually asks.

WHY

Together they cover the core questions: how is revenue trending, what sells best, where are the top markets, and are we acquiring and retaining customers. Four focused visuals rather than a cluttered page.

Build the Four Visuals

AtliQ Sales Dashboard: revenue by month, city, product, and the cohort matrix

STEP 5

Cohort Retention Analysis

WHAT

The cohort matrix groups customers by the month of their first order (cohort), against order month. Yellow cells mark new acquisition (first order), a blue gradient shows returning-order intensity, and blank cells show no activity.

WHY

This is the sharpest visual: it reads new vs returning directly from its structure. The diagonal is acquisition, everything after it is retention. It reveals that acquisition happened in the first four months, and later months are entirely repeat business.

Cohort Retention Analysis

Cohort info popup: yellow = new customers, blue = returning, darker = more orders

STEP 6

Interactivity and Definitions

WHAT

Added a date-range slicer and a category slicer so the whole dashboard filters together. Documented the revenue definition and the cohort reading as info-icon popups, so the dashboard is self-explanatory.

WHY

Slicers make the report explorable rather than static. Stating the revenue definition on the dashboard removes ambiguity about what the numbers mean, and the cohort popup makes a sophisticated visual readable at a glance.

Interactivity and Definitions

Date and category slicers, with the Revenue Definition popup open

Milestone 6 Complete

What this milestone delivered

Dashboard on Gold

A Power BI report on the Gold star schema, four visuals answering revenue, product, market, and customer questions.

Cohort retention

A first-order cohort matrix showing new acquisition and returning retention in one view, self-documented via an info popup.

Clear and interactive

Date and category slicers filter the whole page, and the revenue definition is stated on the dashboard for unambiguous numbers.

1

revenue definition stated

Engineering decision: served Gold to Power BI via a direct Databricks warehouse connection, because Gold's managed Unity Catalog tables made a OneLake shortcut impractical and mirroring hit a storage-permission limit. The dashboard requirement is met; the serving method differs from the guide's suggested shortcut, a reasoned response to the architecture.
